
Alien

In 2201, humanity has discovered an Earth-like planet Jol1B3. More amazingly, we have found that the planet is inhabited by an alien race that is very similar to us. After several weeks of research, the scientists believe that they have solved the structure of the alien language. They found out that their language is the same as English, the only difference is they always end their word with "szs". They also found that they can only understand a sentence if it contains exactly three words. The scientists want to try to communicate with them, so they ask you to create a program to translate some words in English to the alien language.

Format Input

The input will consist of two lines of words that need to be translated.

Format Output

Print the two lines of translated words, each word should be separated by a space.

Constraints

Each line consists of exactly three words, each word is separated by exactly one space.

Each word will only contain lowercase and uppercase English alphabets and will be at most 20 characters long.
